# Package 'statr'

July 10, 2018
Type Package
Title Matt Galloway Personal R Package
Version 0.1.0
<b>Description</b> This is a personal R package. It contains a number of various R functions for organization and convenience purposes.
<pre>URL https://github.com/MGallow/statr</pre>
BugReports https://github.com/MGallow/statr/issues
License GPL (>= 2)
ByteCompile TRUE
Encoding UTF-8
LazyData true
RoxygenNote 6.0.1
Imports dplyr, ggplot2, magrittr, formatR, grid, devtools, ADMMsigma, glmnet
Suggests testthat, knitr, rmarkdown, pkgdown
SystemRequirements GNU make
VignetteBuilder knitr
R topics documented:
bsearch       2         compound       3         CVsplit       3         data_gen       4         dense       4

# Description

bsearch

Index

Minimizes a univariate strictly pseudoconvex function over the interval [a, b]. This is augmented code from Adam Rothman's STAT 8054 course (2017).

# Usage

```
bsearch(dg, a, b, L = 1e-07, quiet = FALSE)
```

Bisection search

# Arguments

dg	the derivative of the function to minimize, where $dg(u,)$ is the function evaluated at $u.$
а	left endpoint of the initial interval of uncertainty.
b	right endpoint of the initial interval of uncertainty.
L	the maximum length of the final interval of uncertainty.
quiet	should the function stay quiet?
	additional argument specifications for dg

# Value

returns the midpoint of the final interval of uncertainty.

compound 3

com	noi	ınd

Generate compound symmetric matrices

# Description

Generate a p-dimensional compound symmetric matrix.

# Usage

```
compound(p = 8, n = NULL)
```

# Arguments

p desired dimension

n option to generate n observations from covariance matrix S

## **Examples**

```
compound(p = 10, n = 100)
```

CVsplit

CV split

# Description

splits data objects into training and testing sets

# Usage

```
CVsplit(X, Y, split = 0.5, N = NULL)
```

# **Arguments**

X	nxp data matrix. Each row corresponds to a single observation and each column contains n observations of a single feature/variable.
Υ	nxr response matrix. Each row corresponds to a single response and each column contains n response of a single feature/response.
split	fraction of objects devoted to training set
N	option to provide number of objects devoted to training set

# Value

X.train, Y.train, X.test, Y.test

4 dense

data\_gen

Normal Linear Data Generator

# Description

True beta values are generated from  $p^*r$  independent draws from N(0, 1/p) distribution. X are n independent draws from p multivariate normal N(0, SigmaX). Y is then generated using X and true beta values with an iid error term that follows r multivariate normal distribution N(, Sigma).

#### Usage

```
data_gen(n, p, r = 1, sparsity = 0.5, Sigma = c("tridiag", "dense",
  "denseQR", "compound"), s = NULL, SigmaX = c("tridiag", "dense",
  "denseQR", "compound"), sx = NULL, ...)
```

## Arguments

n	desired sample size
p	desired dimension
r	number of responses
sparsity	desired sparsity for beta
Sigma	covariance matrix structure used to generate $Y \mid X$
S	option to specify diagonal elements in Sigma
SigmaX	covariance matrix structure used to generate data X
sx	option to specify diagonal elements in SigmaX
	additional arguments to pass to data generating functions

## Value

```
Y, X, betas, Sigma, SigmaX
```

dense

Generate dense matrices

## **Description**

Generate p-dimensional matrices so that its inverse is dense.

# Usage

```
dense(p = 8, base = 0.9, n = NULL)
```

# Arguments

р	desired dimension		
base	base multiplier		
	_	_	

n option to generate n observations from covariance matrix S

denseQR 5

## **Examples**

```
dense(p = 10, base = 0.9)
```

denseQR

Generate dense matrices (via spectral decomposition)

## **Description**

Generate p-dimensional matrices so that its inverse is dense. The matrix will be generated so its first 'num' eigen values are 1000 and the remaining are 1. The orthogonal basis is generated via QR decomposition of

## Usage

```
denseQR(p = 8, num = 5, n = NULL)
```

## **Arguments**

p desired dimension

num number of 'large' eigen values. Note num must be less than p
n option to generate n observations from covariance matrix S

## **Examples**

```
denseQR(p = 10, num = 10)
```

derivative

Derivative

## **Description**

Takes the approximate derivative for a given function

## Usage

```
derivative(g, x, delta = 1e-07)
```

## **Arguments**

g the derivative of the function to minimize, where dg(u, ...) is the function evalu-

ated at u.

x value to evaluate the derivative at

delta defaults to 10e-8

6 dsearch

diagnostic	Diagnostic
------------	------------

# Description

This function simply streamlines the process of creating diagnostic plots with ggplot

# Usage

```
diagnostic(data., x., y.)
```

# Arguments

data data frame x. x-axis y. y-axis

## Value

a residual plot and QQ plot

# **Examples**

```
diagnostic(iris, Sepal.Length, Sepal.Width)
```

dsearch Dichotomous search

# Description

Minimizes a univariate strictly quasiconvex function over the interval [a, b]. This is augmented code from Adam Rothman's STAT 8054 course (2017).

# Usage

```
dsearch(g, a, b, L = 1e-07, eps = (L/2.1), quiet = FALSE)
```

# Arguments

g	the function to minimize, where $g(u,)$ is the function evaluated at $u.$
а	left endpoint of the initial interval of uncertainty.
b	right endpoint of the initial interval of uncertainty.
L	the maximum length of the final interval of uncertainty.
eps	search parameter, must be less than L/2
quiet	should the function stay quiet?
	additional argument specifications for g

#### Value

returns the midpoint of the final interval of uncertainty.

7 fro

fro Frobenius norm

# Description

calculates the frobenius norm of an object

# Usage

fro(X)

## **Arguments**

Χ object

# Value

norm

LASS0 Lasso regression

# **Description**

calculate lasso regression coefficients using the optimal tuning parameter from the glmnet package.

# Usage

```
LASSO(X, Y, lam = NULL, intercept = FALSE, standardize = FALSE)
```

# Arguments

Υ

Χ nxp data matrix. Each row corresponds to a single observation and each column contains n observations of a single feature/variable.

nxr response matrix. Each row corresponds to a single response and each col-

umn contains n response of a single feature/response.

lam tuning parameter

# Value

betas, lam

8 multiplot

LDA

Linear Discriminant Analysis

# Description

this function fit the LDA model

# Usage

```
LDA(X, y, method = c("MLE", "diagonal", "ridge"), lam = NULL)
```

# **Arguments**

method

x n x p matrix where the ith row is the values of the predictor for the ith case
y n entry response vector where the ith entry is the response category in 1, ..., C
for the ith case

estimation method

lam optional tuning parameter specification

#### Value

returns a list with the parameter estimates

multiplot

Multiple Plot

# Description

Taken from: http://www.cookbook-r.com/Graphs/Multiple\_graphs\_on\_one\_page\_(ggplot2)/

# Usage

```
multiplot(..., plotlist = NULL, cols = 1, layout = NULL)
```

## **Arguments**

... object can be passed in

plotlist plotlist

cols number of columns in layout

layout a matrix specify the layout. If present, 'cols' is ignored

## Value

plots

predict\_QDA 9

## **Description**

this function classifies test data using a fitted QDA model

# Usage

```
predict_QDA(fit, Xtest)
```

## **Arguments**

fit this is a list with elements pi.hats, mu.hats, and Sigma.hats where pi.hats is a list

of C response category sample proportions, mu.hats is a list of C p-dimensional sample mean proportions, Sigma.hats is a list of C p by p Sample covariance

matrices

Xtest this is a matrix with ntest rows and p column, each row is a test case

#### Value

returns a vector of ntest entries, where the ith entry is the estimated response category (some value in 1, ..., C) for the ith test case.

QDA

Quadratic Discriminant Analysis

# Description

this function fit the QDA model

## Usage

```
QDA(X, y, method = c("MLE", "diagonal", "ridge"), lam = NULL)
```

## **Arguments**

X n x p matrix where the ith row is the values of the predictor for the ith case

y n entry response vector where the ith entry is the response category in 1, ..., C

for the ith case

method estimation method

lam optional tuning parameter specification

#### Value

returns a list with the parameter estimates

10 scatter

RIDGE

Ridge regression

## Description

calculate ridge regression coefficients using the optimal tuning parameter from the glmnet package.

## Usage

```
RIDGE(X, Y, lam = NULL, intercept = FALSE, standardize = FALSE)
```

## **Arguments**

X nxp data matrix. Each row corresponds to a single observation and each column

contains n observations of a single feature/variable.

Y nxr response matrix. Each row corresponds to a single response and each col-

umn contains n response of a single feature/response.

lam tuning parameter

#### Value

betas, lam

scatter

Scatter

# Description

This function simply streamlines the process of creating a scatterplot with ggplot

# Usage

```
scatter(data., x., y.)
```

# Arguments

data data frame
x. x-axis
y. y-axis

#### Value

a scatterplot

## **Examples**

```
scatter(iris, Sepal.Length, Sepal.Width)
```

tidy 11

tidy Tidy

## **Description**

tidys package R code and updates package documentation. Directly uses Yihui Xie's 'formatR' package.

# Usage

tidy()

timeit

Time-It

# Description

Simple function that prints the computation time of a function

# Usage

timeit(f)

## **Arguments**

f

the function to time

#### Value

returns the elapsed time

tridiag

Generate tri-diagonal matrices

# Description

Generate p-dimensional matrices so that its inverse is tri-diagonal.

#### Usage

```
tridiag(p = 8, base = 0.7, n = NULL)
```

## **Arguments**

p desired dimension base base multiplier

n option to generate n observations from covariance matrix S

## **Examples**

```
tridiag(p = 10, base = 0.7)
```
